

C12 – serious power distribution – in a compact format

The C12 is a 12-channel power distribution unit that combines class-leading protection with truly intelligent load and functional monitoring.

Based on the same proven technology as its big brother the C24, the C12 also includes a web-server that enables real-time remote monitoring of all connected loads, incoming power and system status.

Never before has so much protection been available in such a compact format.

- The C12 has twelve channels each protected by a 16A magnetic-hydraulic RCBO that takes care of overcurrent as well as residual current protection. These breakers makes very long cable runs possible, typically 2-3 times longer than with conventional thermal-magnetic breakers.
- The C12 is fitted with a fast-acting over-voltage protection systems, cutting the power and saving the equipment in case of a supply issue (including loss of neutral).
- Each channels of the C12 has a load indicator that shows the presence of a load (green) and any overloading condition (flashing red).
- A multi-function meter enables checking of all incoming voltages before switching on the unit. During operation, this meter also show the incoming currents including the neutral current.
- An E-stop that trips the main disconnecter enables rapid shutdown.
- Available with 19-pole “Socapex”, Harting 16-pole, Harting 10-pole and TRUE1 connectors.
